

## JOB OFFER

Position in the project:	Student
Scientific discipline:	physics, biophysic, medical physics, computer science, electronics
Job type (employment contract/stipend):	stipend
Number of job offers:	2
Remuneration/stipend amount/month:	1 500 PLN/month
Position starts on:	01.09.2018
Maximum period of contract/stipend agreement:	12 months
Institution:	Jagiellonian University, Faculty of Physics, Astronomy and Applied Computer Science
Project leader:	Prof. dr hab. Paweł Moskal
Project title:	Jagiellonian Positron Emission Tomography: a novel in vivo morphometric imaging with positronium  Project is carried out within the TEAM programme of the Foundation for Polish Science
Project description:	The project aims at the elaboration of novel cancer staging indicators based on the properties of positronium atoms formed in the human body during the PET diagnosis and the elaboration of the method for in vivo imaging of these indicators. The basis of the research constitutes the Jagiellonian Positron Emission Tomograph (J-PET) whose novelty lies in employing long strips of plastic scintillators instead of small size crystals as detectors of annihilation photons. We will explore new possibilities opened by the J-PET tomograph enabling measurement of the lifetime and production probability of positronium atoms formed copiously inside human body during the routine PET imaging. This fact was never used so far in the medical diagnosis. The probability of creation and lifetime of an ortho-positronium atom depend strongly on the size of the free volumes between molecules. By the realization of this project we aim at (i) establishing correlations between values of novel indicators based on properties of positronium atoms trapped in the inter-molecular voids inside the cells and the routinely available histopathological characteristics of tumors as well as (ii) evaluation

	and validation of the method for the reconstruction of novel morphometric images showing the spatial distribution in the diagnosed organism of positronium properties such as: mean lifetime, production probability and ratio of annihilation rates into two and three photons.
Key responsibilities include:	<p>Student-1: Development of the data acquisition system for the modular J-PET tomograph</p> <p>Student-2: Development of the 2-photon image reconstruction with the modular J-PET tomograph.</p>
Profile of candidates/requirements:	<p>Bachelor's degree in the field of Natural Sciences, Engineering, Computer Science, Mathematics or related field of science.</p> <p>A strong motivation to conduct experimental research.</p> <p>Good knowledge of English (spoken and written).</p> <p>Student-1 : Experience in data analysis and simulations,, computer programming, and preferably image reconstruction methods.</p> <p>Student-2 : Experience with programmable electronics (FPGA), computer programming, and preferably data acquisition systems.</p>
Required documents:	<p>The candidates should submit applications containing the following documents</p> <ol style="list-style-type: none"> <li>1. Short application including motivation letter (maximum two pages),</li> <li>2. Scientific CV including list of publications and list of presentations at conferences,</li> <li>3. At least one letter of recommendation</li> </ol>
We offer:	We offer interdisciplinary research in the international group in the unique laboratory with the first in the world multi-photon positron emission tomograph. The project interfaces technologies from a variety of disciplines including biology, biophysics, computer science, electronics, engineering, physics and medicine.
Please submit the following documents to:	p.moskal@uj.edu.pl
Application deadline:	13.05.2017
