# Total-Body J-PET from plastic scintillators

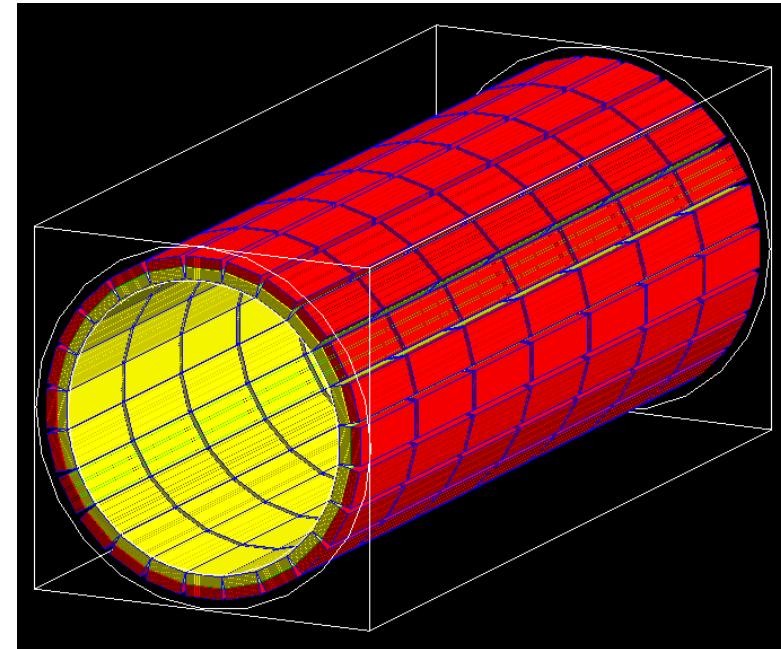

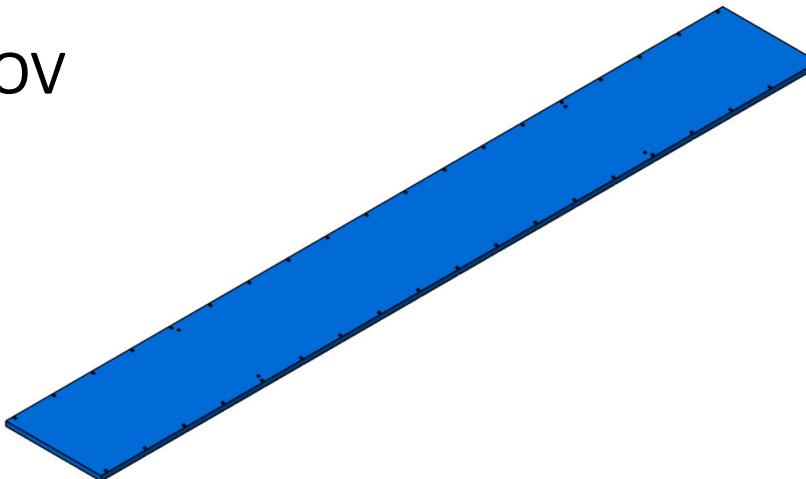

# Total-Body J-PET from plastic scintillators

# Total-Body J-PET from plastic scintillators

Total-Body J-PET:

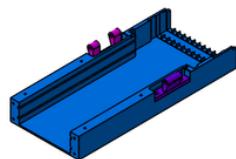

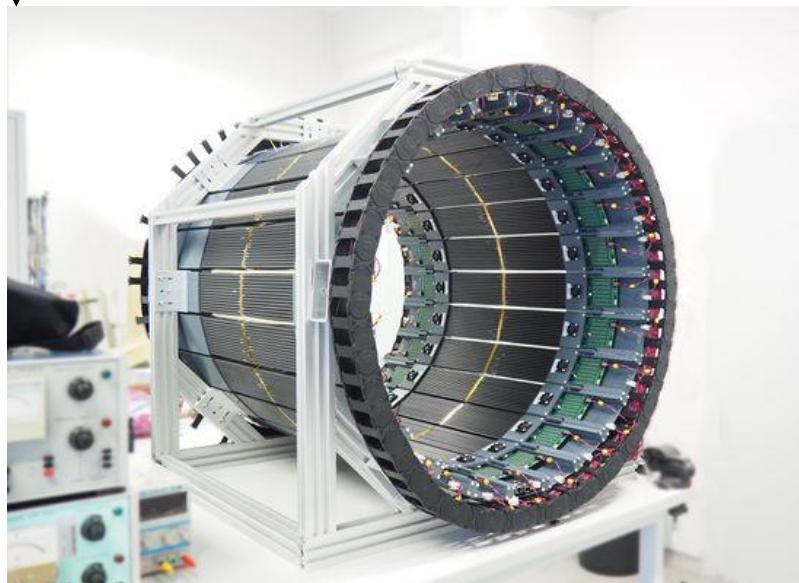

- 16 ( $6 \times 30 \text{ mm}^2$ ) plastic scintillator strips per layer
- 2 layers per module
- 1 layer of (dimensions) wavelength-shifting (WLS) strips per module
- 24 modules per ring
- 7 rings each of 33 cm AFOV
- 2 cm gap between rings
- Total AFOV = 243 cm

# On a way to the Total-Body J-PET

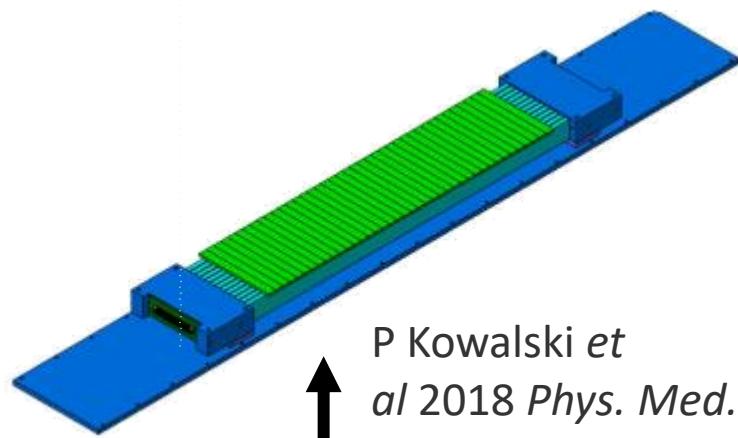

Currently commissioned J-PET:

- 13 ( $6 \times 24 \text{ mm}^2$ ) scintillators per layer
- 1 layer per module
- 24 modules per ring
- 1 ring of 50 cm AFOV

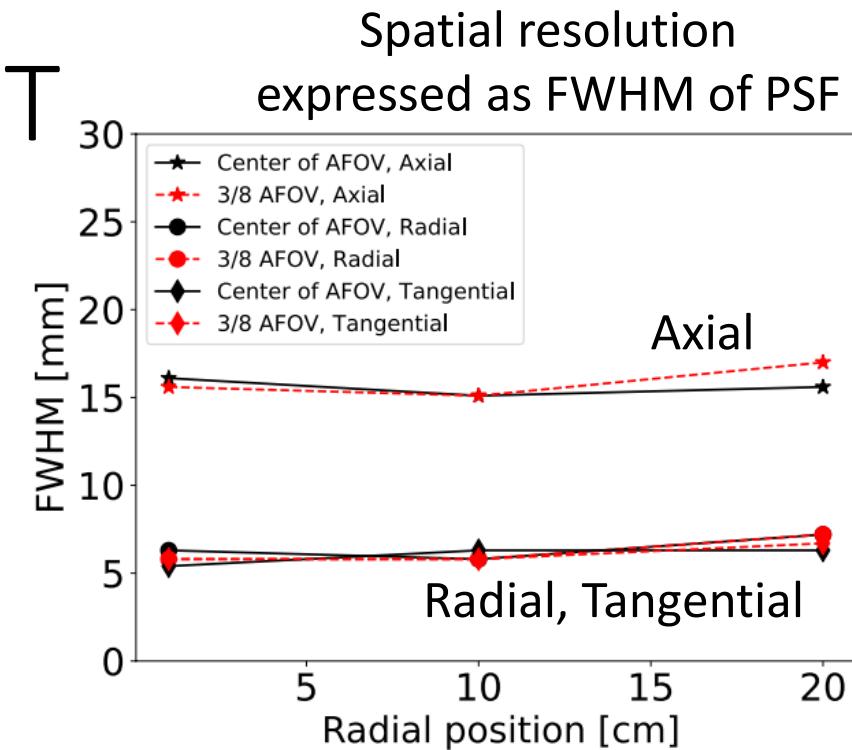

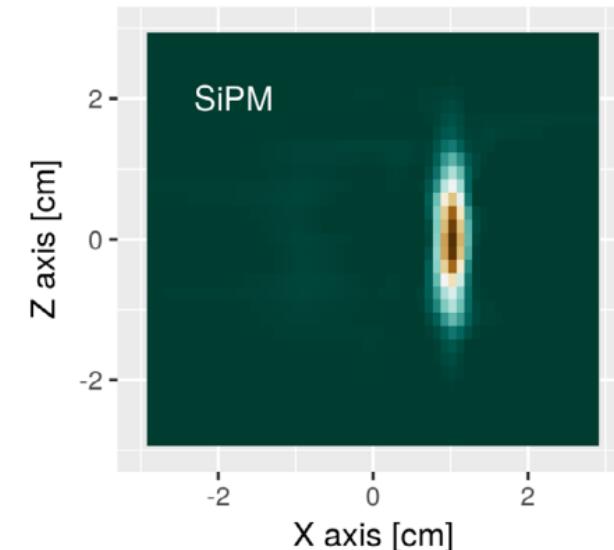

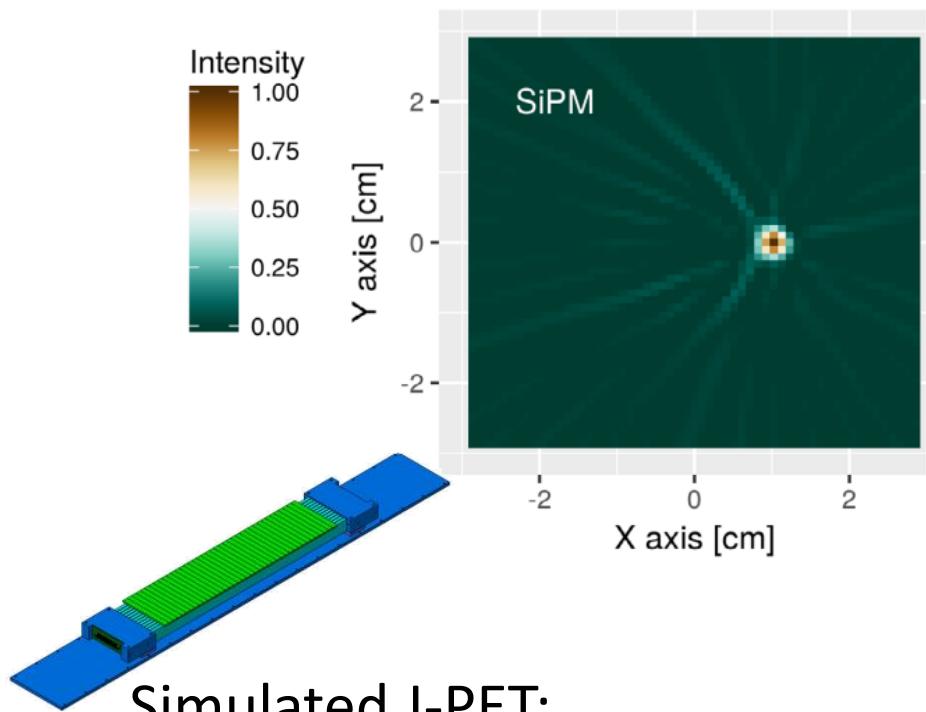

Simulated J-PET:

- $7 \times 20 \text{ mm}^2$  scintillators per layer
- 1 layer per module
- 1 layer of WLS per module
- 24 modules per ring
- 1 ring of 50 cm AFOV

Spatial resolution	FWHM [mm]
Radial	4.8
Tangential	4.8
Axial	7.8

Spatial resolution expressed  
as FWHM of PSF

Hit transaxial position estimated as  
center of the scintillator in the  
transaxial cross section

# Simulation of WLS response

In order to take into account some WLS, geometry and SiPM effect, a number of efficiencies has been added:

- 0.96 - fraction of photons passing the interface air-WLS
- 0.75 - fraction of photons absorbed in WLS
- 0.86 - fluorescence efficiency of WLS

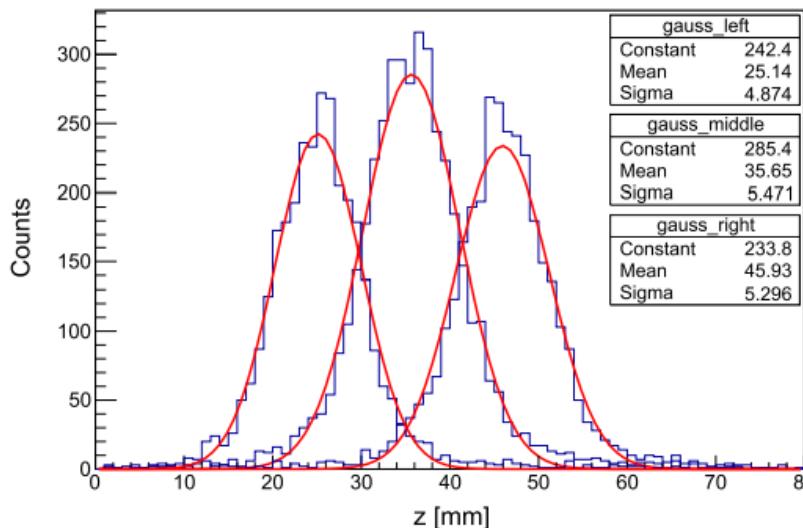

- 0.28 - fraction of confined photons propagating towards one end of a WLS strip
- 0.60 - coverage of WLS face with SiPM
- 0.62 - SiPM fill factor
- 0.35 - photon detection efficiency at 500 nm

# Validation of the simulation method
